

What is Atomian?

Atomian is a technological R&D company that develops and commercialises software products based on cognitive computing.

The team that founded Atomian worked for 15 years to research and formulate a scientific theory to provide a cognitive framework and a range of software applications.

We have created a digital brain with the capacity to understand the surrounding world.

Mission&Vision

Research is Atomian's fundamental vocation. Our aim is to install a digital brain in all business environments, with a cognitive database that enables the use of knowledge based on natural language, and that can learn new information and automate business processes.

Atomian's mission is to humanise information, providing opportunities for natural discourse. We envisage a future with a large cognitive database that stores all of the information recorded by humans and machines.

"It is surely possible to create a group of symbols, axioms, data structures and algorithms, to reproduce the same behavioural patterns and faculties as the cognitive processes in the human brain".
Atomian, 2004

The team

We are a young and idealistic team in Atomian, and we believe that technology is a force for change in society. We see innovation as a means to make knowledge available to everyone, in order to share technological advancements and contribute to human development.

Who sees the benefits of a digital brain?

Our investors and advisors

Atomian has a diverse group of investors and advisors, mainly from the technology sector, with an essential role in this innovative and promising project. They demonstrate a high level of commitment, and provide stability and business expertise to the company, helping us to follow technological developments for cognitive software products and to sell these products to businesses and other organisations on a global scale.

How does the brain work?

This question asked over 10 years ago has inspired the creation of a digital brain.
